

1. External CSS enables you to dictate how a whole site should look, only by making one single file, and have a uniform appearance on every page.
2. CSS enables you to tailor the appearance of input fields and buttons in terms of the layout, colors and spacing to appear modern and professional. It also enhances usability through visual feedbacks, including changing the color of buttons when a user passes his/her cursor over them.
3. Without the proper linking of the CSS file, the browser will show only the raw HTML text without style, colors or particular layouts. The webpage will be plain black text on white background and things such as pictures or forms will appear out of order.
4. Forms are sometimes the most difficult to style since each of the browsers has its default settings of input fields and buttons which may be hard to customize. To have a regular appearance of these interactive elements, it is necessary to use padding, borders and alignment properties accurately.
