

1. Internal CSS is located within the `<style>` tag, which is placed inside the `<head>` section of the HTML document. This centralizes the styling rules for that specific page in one location rather than scattering them throughout the body.
2. It is better because it allows you to style multiple elements at once using a single rule, making the code much cleaner and easier to manage. This separation of content and design reduces repetition and allows for faster updates across the entire page.
